

The Problems With Traditional Medicine

The prevention and/or cure of disease have eluded modern medicine's most noble efforts. Billions of Dollars are thrown at scientific researchers every year in efforts to find solutions to health problems. Even the most powerful nation in the World, The United States of America, will soon be faced with economic collapse if solutions are not found to the escalating cost of health care.

Empty Food

Many of the minerals and micronutrients essential for health are no longer present in our food. Farmland has been overworked by the practice of planting crops on the same ground, year after year, without replenishing the soil with minerals. This situation is worsened by adding huge quantities of chemical fertilizers, further destroying the natural balance. This practice may produce large and plentiful crops, but they are deficient in the minerals and nutrients needed by the Human organism to remain healthy and defend itself.

The Dilemma

This situation defines the dilemma in maintaining health and fighting disease. Even organic and natural foods found in health food stores are grown under much of the same conditions. Even though toxic substances may not be used, fertilizers are still deficient in the nutrients required optimal health. The nutrients found in natural cow manure fertilizer cannot contain any more minerals than the soil that produced the grass the cow ate.

Even more problematic, the so-called authority on nutritional values and daily requirements (The Food & Drug Administration) is not even aware of the actual nutrients needed to support optimal health.

As A result, many top Medical Doctors and scientific researchers have reconsidered their strategies. These medical professionals are going away from the treatment of symptoms with pharmaceuticals, and, instead, are turning to natural medicines and alternative therapies which allow the human organism to correct itself.
